

The background features a dark blue gradient with faint, light blue circular patterns and a scale. The scale is a large arc on the left side, with numbers ranging from 140 to 260 in increments of 10. There are also several smaller circles and dashed lines scattered across the background, some with arrows indicating direction.

## Coronavirus's next victim? Our mental health

As a nation, we must be prepared for the mental health pandemic that will follow the pandemic.

## Flattening the Second (Hidden) Curve: Taking Care of Our Mental Health

RESEARCH LETTER

**Psychological Distress and Loneliness Reported by US Adults in 2018 and April 2020**

Coronavirus disease 2019 (COVID-19) introduced stressors to mental health, including loneliness stemming from social isolation, fear of contracting the disease, economic strain, and uncertainty about the future. We fielded a national survey measuring symptoms of psychological distress and loneliness among US adults in April 2020 and compared results with national data from 2018.

**Methods** | We fielded the Johns Hopkins COVID-19 Civic Life and Public Health Survey from April 7 to April 13, 2020, using NORC’s AmeriSpeak Panel. AmeriSpeak is a probability-based panel designed to be representative of the US adult population. The panel is sourced from NORC’s area probability sample and from a US Postal Service address-based sample covering 97% of US households.<sup>1</sup> The panel has a recruitment rate of 34% and includes approximately 35 000 members. The sample for the Johns Hopkins survey was drawn from this panel and the survey was administered online. NORC obtains informed consent prior to enrolling individuals in the panel. The Johns Hopkins Bloomberg School of Public Health institutional review board deemed this study not human participants research and waived informed consent.

We measured the prevalence of symptoms of serious psychological distress in the overall sample and among demographic subgroups using the Kessler 6 Psychological Distress Scale, with the validated measure of serious distress defined as a score of 13 or higher on the 0- to 24-point scale.<sup>2</sup> We also measured the proportion of respondents who reported that they always or often feel lonely in response to the item “How often do you feel lonely?” with response options always, often, sometimes, rarely, and never.

We compared the prevalence of symptoms of serious psychological distress in April 2020 with an identical measure from the 2018 National Health Interview Survey (NHIS), which used the Kessler 6 scale among 25 417 adults aged 18

Figure. Psychological Distress Among US Adults Aged 18 Years or Older Overall and by Subgroup, April 2020 vs 2018

ABSTRACT

The pandemic of 2019 coronavirus disease (COVID-19) has burdened an unprecedented psychological stress on people around the world, especially the medical workforce. The study focuses on assess the psychological status of them. The authors conducted a single-center, cross-sectional survey via online questionnaires. Occurrence of fear, anxiety and depression were measured by the numeric rating scale (NRS) on fear, Hamilton Anxiety Scale (HAM-A), and Hamilton Depression Scale (HAM-D), respectively. A total of 2299 eligible participants were enrolled from the authors' institution, including 2042 medical staff and 257 administrative staff. The severity of fear, anxiety and depression were significantly different between two groups. Furthermore, as compared to the non-clinical staff, front line medical staff with close contact with infected patients, including working in the departments of respiratory, emergency, infectious disease, and ICU, showed higher scores on fear scale, HAMA and HAM-D, and they were 1.4 times more likely to feel fear, twice more likely to suffer anxiety and depression. The medical staff especially working in above-mentioned departments made them more susceptible to psychological disorders. Effective strategies toward to improving the mental health should be provided to these individuals.

# POTENTIAL MENTAL HEALTH CONSEQUENCES OF COVID-19

- Short-term: Among people hospitalized with SARS or MERS - more than 25% experienced symptoms such as poor concentration, confusion and rapid fluctuations in mood – signs of possible *delirium*
  - Early data on COVID-19 indicate similar findings
- Long-term: Increases in depression, anxiety, self-harm, and suicide
  - During SARS epidemic in 2003:
    - 30% increase in suicide in those aged 65 years and older
    - ~50% of recovered patients remained anxious
    - 6 months after infection, 15% had significant depression, 15% had an anxiety disorder, 19% had chronic fatigue, 30% had PTSD
    - 29% of health-care workers experienced probable emotional distress
  - Increases in domestic violence, child abuse (with less reporting of it), substance abuse, and gambling
  - Loss of loved ones, grieving, PTSD
  - Stress from social isolation, loss of financial resources, and repeated media consumption regarding pandemic

## Neurologic Manifestations of Hospitalized Patients With Coronavirus Disease 2019 in Wuhan, China

Ling Mao, Huijuan Jin, Mengdie Wang, Yu Hu, Shengcai Chen, Quanwei He, Jiang Chang, Candong Hong, Yifan Zhou, David Wang, Xiaoping Miao, Yanan Li, MD, PhD; Bo Hu, MD, PhD

**IMPORTANCE** The outbreak of coronavirus disease 2019 (COVID-19) in Wuhan, China, is serious and has the potential to become an epidemic worldwide. Several studies have described typical clinical manifestations including fever, cough, diarrhea, and fatigue. However, to our knowledge, it has not been reported that patients with COVID-19 had any neurologic manifestations.

**OBJECTIVE** To study the neurologic manifestations of patients with COVID-19.

**DESIGN, SETTING, AND PARTICIPANTS** This is a retrospective, observational case series. Data were collected from January 16, 2020, to February 19, 2020, at 3 designated special care centers for COVID-19 (Main District, West Branch, and Tumor Center) of the Union Hospital of Huazhong University of Science and Technology in Wuhan, China. The study included 214 consecutive hospitalized patients with laboratory-confirmed diagnosis of severe acute respiratory syndrome coronavirus 2 infection.

### Abstract

Following the severe acute respiratory syndrome coronavirus (SARS-CoV) and Middle East respiratory syndrome coronavirus (MERS-CoV), another highly pathogenic coronavirus named SARS-CoV-2 (previously known as 2019-nCoV) emerged in December 2019 in Wuhan, China, and rapidly spreads around the world. This virus shares highly homological sequence with SARS-CoV, and causes acute, highly lethal pneumonia coronavirus disease 2019 (COVID-19) with clinical symptoms similar to those reported for SARS-CoV and MERS-CoV. The most characteristic symptom of patients with COVID-19 is respiratory distress, and most of the patients admitted to the intensive care could not breathe spontaneously. Additionally, some patients with COVID-19 also showed neurologic signs, such as headache, nausea, and vomiting. Increasing evidence shows that coronaviruses are not always confined to the respiratory tract and that they may also invade the central nervous system inducing neurological diseases. The infection of SARS-CoV has been reported in the brains from both patients and experimental animals, where the brainstem was heavily

- Evidence from animal and human studies on other coronaviruses that brain infection can occur
- Brainstem and thalamus may be particularly vulnerable
- Effects on respiratory function better understood than effects on neurocognitive and emotional functioning
- Some brain effects may be delayed

## Multidisciplinary research priorities for the COVID-19 pandemic: a call for action for mental health science

Emily A Holmes\*, Rory C O'Connor\*, V Hugh Perry, Irene Tracey, Simon Wessely, Louise Arseneault, Clive Ballard, Helen Christensen, Roxane Cohen Silver, Ian Everall, Tamsin Ford, Ann John, Thomas Kabir, Kate King, Ira Madan, Susan Michie, Andrew K Przybylski, Roz Shafran, Angela Sweeney, Carol M Worthman, Lucy Yardley, Katherine Cowan, Claire Cope, Matthew Hotopf†, Ed Bullmore†

The coronavirus disease 2019 (COVID-19) pandemic is having a profound effect on all aspects of society, including mental health and physical health. We explore the psychological, social, and neuroscientific effects of COVID-19 and set out the immediate priorities and longer-term strategies for mental health science research. These priorities were informed by surveys of the public and an expert panel convened by the UK Academy of Medical Sciences and the mental health research charity, MQ: Transforming Mental Health, in the first weeks of the pandemic in the UK in March, 2020. We urge UK research funding agencies to work with researchers, people with lived experience, and others to establish a high level coordination group to ensure that these research priorities are addressed, and to allow new ones to be identified over time. The need to maintain high-quality research standards is imperative. International collaboration and a global perspective will be beneficial. An immediate priority is collecting high-quality data on the mental health effects of the COVID-19 pandemic across the whole population and vulnerable groups, and on brain function, cognition, and mental health of patients with COVID-19. There is an urgent need for research to address how mental health consequences for vulnerable groups can be mitigated under pandemic conditions, and on the impact of repeated media consumption and health messaging around COVID-19. Discovery, evaluation, and refinement of mechanistically driven interventions to address the psychological, social, and neuroscientific aspects of the pandemic are required. Rising to this challenge will require integration across disciplines and sectors, and should be done together with people with lived experience. New funding will be required to meet these priorities, and it can be efficiently leveraged by the UK's world-leading infrastructure. This Position Paper provides a strategy that may be both adapted for, and integrated with, research efforts in other countries.

# RESEARCH PRIORITIES I – MH ASSESSMENT

- Monitoring increases in prevalence of mental health and neurological problems and disorders
- Identifying highest-risk populations, typically
  - Socially and economically disadvantaged groups
  - Older people and those with medical comorbidities
  - People with disabilities
  - Front-line health care workers
  - Children
  - People with pre-existing mental health conditions
  - People with neurodevelopmental disabilities
- Validity of data from digital assessment apps
- Identification of cohorts, and population studies are needed

# RESEARCH PRIORITIES II - TREATMENT

- Effectiveness of remote mental health interventions led by a MH professional
- Effectiveness of digital mental health apps
- Effective ways to build and/or maintain resilience and wellness skills during social isolation
- Methods to maximize adherence to medical advice during pandemic while minimizing harm to the mental health of individuals
- In-person and remote methods to prevent depression and anxiety increases among health care workers
- Effectiveness of methods to prevent toxic and potentially fatal cleaning practices

# RESEARCH PRIORITIES III – CNS EFFECTS OF COVID-19 ON MH

- Neuropsychiatric effects of COVID-19 still mostly unknown
  - Short-term (direct, and via neuroinflammation)
  - Long-term (e.g., Spanish flu pandemic leading to post-encephalitic Parkinsonism)
- BUT, closely related SARS and MERS coronaviruses are both neurotropic and neurotoxic, and caused mental health and neurological disorders
- Infrastructure is needed to study both short- and long-term effects of COVID-19 on brain and mental health
- Research needed on mechanisms of COVID-19 brain infection (neuronal, vascular?) and on its effects
  - Effects on the retina (a part of the CNS) have been observed, with reversible breakdown of the blood-retina barrier due to neuroinflammation, and so retina could serve as a model
- Biomarkers of these mechanisms and effects are needed!
- Databases of neuropsychological findings, psychiatric symptoms and diagnoses, and outcomes are needed
- A BIOPSYCHOSOCIAL APPROACH is critical for research on COVID-19, integrating
  - Brain and other systemic function, psychological factors, and environmental/demographic factors
- Other

## Notice of Intent to Publish Funding Opportunity Announcements for the RADx-UP Initiatives

**Notice Number:** NOT-OD-20-112

### Key Dates

**Release Date:** May 29, 2020

**Estimated Publication Date of Funding Opportunity Announcement:** June 8, 2020

**First Estimated Application Due Date:** July 2020

**Earliest Estimated Award Date:** September 2020

**Earliest Estimated Start Date:** August 2020

### Related Announcements

None

### Issued by

Office of The Director, National Institutes of Health (OD)

### Purpose

NIH Institutes and Centers likely to participate include some or all of the following:

Office of the Director (OD)

*Eunice Kennedy Shriver* National Institute of Child Health and Human Development (NICHD)

National Cancer Institute (NCI)

National Center for Advancing Translational Sciences (NCATS)

### Research Initiative Details

The goal of RADx-UP is to reduce COVID-19 associated morbidity and mortality disparities for those vulnerable and underserved populations that are disproportionately affected by, have the highest infection rates of, and/or are most at risk for adverse outcomes from contracting the virus. This Notice encourages researchers to leverage partnerships with key stakeholders to conduct community-engaged research to understand COVID-19 disparities and to increase access and effectiveness of diagnostic testing interventions among underserved COVID-19 medically and/or socially vulnerable populations.

NIH plans to publish three NOSIs for competitive revision awards as follows:

1. To solicit emergency competitive revision applications to existing awards for large consortia, multi-site trials, centers and other current networks that have adequate capacity, infrastructure, and established community-engaged relationships to support large-scale testing interventions or have the capacity to ramp up quickly to reach underserved or vulnerable populations.
2. Similar to the above, but shifts eligibility to collaborative and individual research awards, generally focused on smaller underserved or vulnerable populations.
3. To solicit research to understand the social, ethical, and behavioral implications (SEBI) of COVID-19 testing in these populations.

The fourth funding opportunity using the U24 activity code will be announced for a Coordination and Data Collection Center (CDCC), a key component of the consortium. The CDCC will serve as a national resource, working with NIH scientific staff and consortium members to provide overarching support and guidance in the following four domains: (1) Administrative Operations and Logistics, (2) COVID-19 Testing Technology, (3) Community and Health System Engagement and (4) Data Collection, Integration and Sharing.

The NIH intends for the awardees of the three NOSIs to serve as one consortium of interlinked, community-engaged, intervention projects across the United States (coordinated by the CDCC) to deploy implementation strategies to improve the reach, acceptance, uptake, and sustainability of COVID-19 testing and ultimately understand COVID-19 health disparities.

Researchers planning to apply are strongly encouraged to read all four of these interrelated funding opportunities.

## SARS-CoV-2 and the Brain

gregadunn.com

# CDC Data for the USA – June 17<sup>th</sup> 2020

TOTAL CASES  
**2,132,321**  
27,975 New Cases\*

TOTAL DEATHS  
**116,862**  
722 New Deaths\*

# A quick note on annoying nomenclature

## **Disease**

Coronavirus Disease  
(COVID-19)

## **Virus**

Severe Acute Respiratory  
Syndrome Coronavirus 2  
(SARS-CoV-2)

# COVID-19 is not a binary outcome disease!

- There is a strong tendency to think of just two possible outcomes – mortality or survival.
- But as with most things in life, there is a large gray zone in between.
- Survival is of course great, but for many, it's just the beginning of a long road and life may never look quite the same again.
- Asymptomatic disease is also good, but does asymptomatic really = no deleterious outcomes?

- About half of hospitalized [coronavirus](#) patients experience neurological symptoms including dizziness, difficulty concentrating, a loss of smell and taste, seizures, strokes, and weakness, according to a [new review of research](#) published in the *Annals of Neurology*.

# University of Strasbourg (March 3<sup>rd</sup> to April 4<sup>th</sup>)

- 58 patients admitted to the hospital (Median Age of 63)
- 49 of 58 (84%) showed clinically meaningful neurological signs
- 11 individuals received an MRI scan - All showed perfusion anomalies
- 3 of these individuals showed MRI evidence of acute stroke
  
- Of 45 patients discharged, fifteen (33%) showed dysexecutive syndrome consisting of inattention, disorientation, or poorly organized movements in response to command.

Does the Corona Virus actually get into the brain?

# Anosmia and COVID-19

A 25-year-old female radiographer with COVID-19. Signals indicate viral infection (arrow) in the right gyrus rectus, which helps process smell signals.

Save Coronal view

B Axial view

# Brains in a dish - Spheroids

- 350 micrometers in diameter, they are about the size of the eye of a housefly and are just visible to the human eye

# Brains in a dish (Spheroids)

Thomas Hartung,  
C. Korin Bullen,  
Helena Hogberg  
and colleagues  
at Johns Hopkins University

*Important caveat – no Blood Brain Barrier*

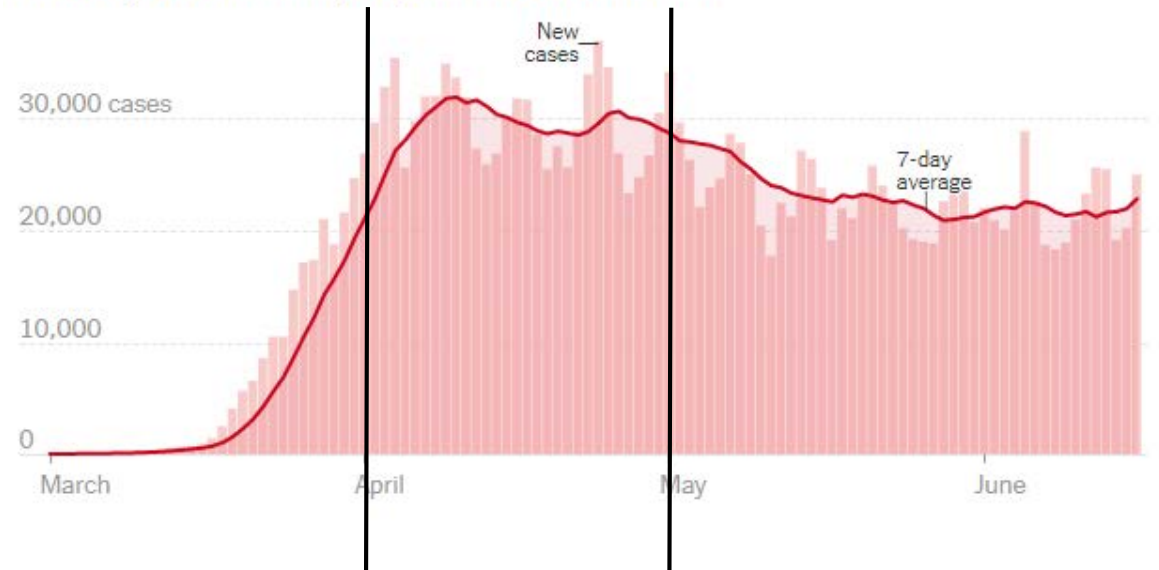

# What about Vertical Transmission?

- Should we be worried about the effect of the virus on the unborn fetus?
- 15% of pregnant women with Covid-19 show severe disease (Lloken et al., 2020)
  - compare that to a rate of about 2% in women in this age bracket (18-49)

New reported cases by day in the United States

- 2<sup>nd</sup> Trimester infections from the initial surge will be coming to term between July and September
- We won't see the first offspring "infected" during the first trimester until October through December

# Things we Neuroscientists are worried about

- We have yet to see whether there are implications for babies born to mothers who contracted COVID-19 in their first and second trimesters – these children haven't been born yet.
- But we do have very recent evidence that it can be transmitted vertically. Vivanti and colleagues (Paris Saclay University Hospital) have presented a case study showing infection in a newborn, with evidence for neurological findings

# Protecting our most vulnerable.

## People With Intellectual Disabilities And Autism Die Of COVID-19 At A Higher Rate

In New York and Pennsylvania, COVID-19 case-fatality rates for people with intellectual and developmental disabilities are higher than the states' overall rates. (Case-fatality rates are deaths as a percentage of total confirmed cases within the population.)

### Notes

Data as of June 3. Numbers for people with intellectual disabilities reflect those who get services from the state.
